The new energy vehicle PTC electric heating controller is a device that inputs the DC power supply through PWM control to drive the new energy vehicle PTC heater, and integrates over-temperature, over-current and other protection devices. It adopts standardized circuit and software design, and can quickly respond to market and market conditions. Customer demand.

The thermal management system of new energy vehicles is very complex, and the market space for the core component PTC electric heater is vast. Due to the low efficiency of the internal combustion engine and sufficient engine waste heat, traditional fuel vehicles have a relatively simple thermal management system, which mainly focuses on refrigeration and heat dissipation. The thermal management system of new energy vehicles is more complex, including refrigeration system, heating system (PTC/heat pump), battery thermal management system (air-cooled/liquid-cooled/direct-cooled), motor electronically controlled cooling system (liquid cooling/ (Independent heat exchange) and the unique engine cooling and gearbox cooling systems of PHEV models. The significant increase in complexity has made the thermal management system the most valuable system in a new energy vehicle besides the three-electric system. It is the alternative to traditional automobile thermal management systems. 3-4 times.
