The brake system scroll compressor is a new type of positive displacement compressor. The scroll compressor is mainly composed of moving scroll, stationary scroll, crankshaft, anti-rotation mechanism and other components. Several pairs of crescents are formed between the moving disk (or turbine rotor) and the stationary disk (or turbine stator). A volume cavity is formed, the static disk is fixed with the casing, the moving disk revolves around the vortex center of the static disk with a certain radius, and the gas in the crescent-shaped volume cavity will be compressed every time it rotates by an angle. The gas is sucked in from the outer circle, and the closer it is to the middle, the greater the pressure, and finally it is compressed to the minimum and discharged from the center.
