According to our (LP Info Research) latest study, the global New Tool Coating Materials market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the New Tool Coating Materials is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global New Tool Coating Materials market. With recovery from influence of COVID-19 and the Russia-Ukraine War, New Tool Coating Materials are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of New Tool Coating Materials. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the New Tool Coating Materials market.

Commonly used coating materials include carbide, nitride, carbonitride, oxide, boride, silicide, diamond and composite coatings. According to the characteristics of chemical bonds, these coating materials can be divided into metal bond type, co-Valence bond type and ionic bond type. With the development of coating technology, the PACVD method integrating PVD and CVD has emerged. In addition, there is an ion beam sputtering method, and the medium energy ion beam assisted deposition technology (IBAD) can also be used for coating. The three most common coating materials are titanium nitride (TiN), titanium carbonitride (TiCN) and titanium aluminum nitride (TiAlN). The newly developed hard coatings include carbon nitride coatings (CN_x), diamond-like

coatings (DLC), AlCrN coatings, etc.; TiSiN coatings suitable for hard cutting, CrSiN coatings with lubricity, and super-resistant Oxidation ability AlCrSiN coating, etc.; there are other nitride coatings (TiN/NbN, TiN/VN, TiBoN), boride coatings (TiB₂, CBN), etc. These coating knives have good high temperature stability and are suitable for High speed cutting use. The combination of physical vapor deposition and chemical vapor deposition can develop a new coated tool. The inner layer of the chemical vapor deposition coating can form a high bonding ability with the substrate, and the outer layer of the physical vapor deposition coating can reduce the cutting force, making the tool suitable for high-speed cutting. Compared with the above hard coatings, the coating of sulfide (MoS₂, WS₂) on high-speed steel is called soft coating, which is mainly used in the cutting of high-strength aluminum alloys, titanium alloys and some rare metals.

At present, the world's manufacturing industry is undergoing a profound strategic reorganization. Developed countries and regions such as Europe, America, Japan, and South Korea are carrying out a new round of optimal allocation of manufacturing resources on a global scale. However, China's manufacturing technology, especially the level of cutting processing, still lags behind that of foreign countries. Thanks to the transformation and upgrading of machine tool industrialization, China's cutting tool market is showing a growth trend, and the market growth rate is higher than the global average. Coated cutting tools are one of the mainstream cutting tool varieties, and the market consumption scale is also growing.
