Genomics is science that studies the composition of biological genomes, the precise structure, interrelationships, and expression regulation of genes in a genome. In genomics, scientists analyze the genomic information of biological samples (tissue, cells, blood samples, etc.) using a novel gene sequencer.

Generation sequencing technology has been developed for 40 years. According to different sequencing principles, gene sequencing technology has been divided into three generations: the first generation of gene sequencing Sanger Sequencing, the second generation of gene sequencing NGS (Next Generation Sequencing), the third generation of gene sequencing TGS.

Next Generation Sequencing (NGS) is a high-throughput method for rapid sequencing of base pairs of DNA or RNA samples. Next generation sequencing systems can be divided by three parts, instruments, consumables and related services. At the same time, NGS also supports a wide range of applications, including gene expression profiling, chromosome counting, epigenetic change detection, and molecular analysis, which can drive discovery research and realize the bright future of personalized medicine.
