Abstracts

The global Ni-NTA Purification Kits market size is predicted to grow from US\$ 231 million in 2025 to US\$ 407 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

Ni-NTA purification kits are affinity purification consumables for His-tagged proteins, in which nickel ions chelated by NTA groups are immobilized on matrices such as agarose, magnetic beads, or pre-packed columns. They typically include Ni-NTA resin, columns or magnetic beads, as well as binding, washing, and elution buffers, and some lysis or detection reagents. These products are used to capture and elute recombinant His-tagged proteins from expression systems such as *E. coli*, yeast, insect cells, and mammalian cells under native or denaturing conditions. They feature short workflows, high selectivity, and scalability across centrifuge columns, gravity columns, magnetic beads, 96-well plates, and FPLC columns. Estimated gross margin is approximately 63%.

Demand side: Driven by recombinant protein production, biopharmaceutical discovery, diagnostic antigen development, enzyme production and synthetic biology, structural biology sample preparation, and high-throughput screening. His-tags remain one of the most commonly used tags in laboratories. Ni-NTA systems are still the default capture solution in research and process development due to stable operation, controllable cost, and compatibility with both native and denaturing conditions. Most customers purchase these products as recurring consumables; single-project spending is modest, but repurchase frequency is high. Key demand comes from universities, research institutes, CROs/CDMOs, and innovative pharmaceutical companies.

Supply side: There is a two-tiered competitive landscape. International brands such as

Thermo Fisher, Qiagen, and Merck maintain advantages in quality consistency, batch stability, comprehensive manuals, and global distribution, suitable for standardized labs and multi-region R&D teams. Chinese brands compete on price, delivery, and local service, covering routine His-tag protein purification, teaching labs, and small to medium R&D projects. Magnetic beads, 96-well plates, and automation-compatible kits are gaining share due to increased screening throughput and sample volume.

Market outlook: This product category is no longer a rapidly expanding new technology. Price competition and product homogeneity limit unit price growth. Growth is driven by increasing protein engineering projects, active synthetic biology R&D, diagnostic antigen and enzyme development, and early-stage biopharma screening requiring reliable purification workflows. Future competition will focus not only on resin binding capacity, but also on low nickel ion leakage, low non-specific adsorption, compatibility with reducing and denaturing agents, completeness of buffer sets, and automation adaptability. Overall, the market is expected to maintain high single-digit growth, lower than the overall protein purification market but higher than general mature laboratory reagents.
