The global Ni-NTA Sensor Chips market size is predicted to grow from US\$ 66.52 million in 2025 to US\$ 116 million in 2032; it is expected to grow at a CAGR of 8.2% from 2026 to 2032.

Ni-NTA sensor chips are label-capture biosensor consumables with surfaces pre-functionalized with NTA or multi-dentate NTA ligands, activated with Ni²⁺ for reversible His-tagged protein capture. They are primarily used with label-free molecular interaction analysis systems such as SPR, HT-SPR, BLI, and GCI. Estimated gross margin is approximately 65%.

Demand side: Driven by antibody discovery, recombinant protein interactions, fragment drug screening, and early-stage biopharma QC. His-tags remain one of the most common protein expression and purification tags. Ni-NTA surfaces enable directional capture under mild conditions and can be regenerated with EDTA or imidazole, providing high throughput efficiency for method development and multi-target screening.

Supply side: Comprised of instrument ecosystem consumables (e.g., Biacore, Octet) and compatible chips from XanTec, Carterra, Nicoya, BioNavis, etc. Single-dentate NTA chips are lower priced but less stable; tri- or multi-dentate NTA, thick hydrogel, and high-throughput array chips command higher prices. Profitability primarily comes from surface chemistry, system compatibility, and batch consistency.

Future growth: Driven by increased SPR/BLI high-throughput installations, expansion of early-stage biopharma outsourcing, and ongoing replacement demand for low-drift, regenerable, and high-capacity surfaces.
