The global Nickel Paste (? 200 nm) for MLCC Inner Electrode market size is predicted to grow from US\$ 650 million in 2025 to US\$ 1161 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

In 2024, global nickel paste (? 200 nm) for MLCC inner electrode production reached approximately 1,136 tons, with an average global market price of around US\$ 206/kg. Nickel Paste for MLCC Inner Electrode refers to a conductive slurry specially formulated for use in the internal electrodes of Multilayer Ceramic Capacitors (MLCCs). It consists of submicron nickel particles dispersed in an organic vehicle system containing solvents, binders, dispersants, and other additives. Its primary function is to create internal conductive layers between ceramic dielectric sheets during the co-firing process, supporting the miniaturization and high-performance requirements of modern electronic devices. In the report, the data is mainly based on nickel paste with diameter ? 200 nm which is used in MLCC inner electrode.

With the continuous development of the electronics industry, particularly amidst the growing demand for high-performance electronic products, multilayer ceramic capacitors (MLCCs), as a key electronic component, are seeing their applications continue to expand. Nickel paste (?200nm) used in MLCC internal electrodes has become a widely used material within the industry due to its excellent conductivity, good temperature stability, and high reliability.

Currently, the application of nickel paste (?200nm) in MLCC internal electrodes primarily enhances capacitor performance and reliability through fine particle design. This nickel paste, with a particle size controlled below 200 nanometers, effectively reduces inter-electrode impedance and improves capacitor performance in high-frequency and high-

current environments. Furthermore, nickel paste exhibits strong adhesion, ensuring a long-lasting bond between the internal electrode and the ceramic dielectric, thereby ensuring stable capacitor operation.

Market-wise, with the continuous advancement of technologies such as 5G communications, the Internet of Things, and smart hardware, demand for high-performance MLCCs has increased dramatically. MLCCs are particularly widely used in smartphones, automotive electronics, and consumer electronics. Nickel paste (?200nm), a key material, has become a core component for improving the electrical performance and production efficiency of MLCCs (MLCCs) as market demand increases. In particular, driven by the design requirements for miniaturized and thinner capacitors, nickel paste miniaturization technology has garnered increasing attention and research.

With the continued advancement of MLCC technology, market demand for nickel paste (?200nm) is expected to steadily grow over the next few years. On the one hand, as electronic products increasingly demand higher performance from capacitors, nickel paste material technology will continue to innovate to meet the demands of operating in specialized environments such as high frequency, high current, and high temperature. On the other hand, as the application scope of MLCCs continues to expand, nickel paste production processes, cost control, and environmental friendliness will become key areas of focus for industry development.
