The global Niobium Disulfide market size is predicted to grow from US\$ 75.33 million in 2025 to US\$ 146 million in 2032; it is expected to grow at a CAGR of 10.1% from 2026 to 2032.

Niobium Disulfide (NbS₂) is a layered transition metal dichalcogenide (TMD) composed of niobium and sulfur, known for its metallic conductivity, excellent chemical stability, and two-dimensional (2D) lamellar structure, which enables applications in energy storage (e.g., battery electrodes), catalysis (hydrogen evolution reaction), lubricants, and advanced electronics. The supply chain begins upstream with raw materials extraction?niobium primarily sourced from minerals such as columbite and pyrochlore (dominated by producers in Brazil and Canada), and sulfur obtained as a byproduct of oil and gas refining. In the midstream, NbS₂ is synthesized through processes such as solid-state reaction (high-temperature sulfurization of niobium metal or niobium oxides), chemical vapor transport (CVT), or chemical vapor deposition (CVD) for high-purity or thin-film forms. Downstream, the material is processed into powders, nanosheets, or coatings and integrated into applications across energy storage systems, electrocatalysis, solid lubricants, and emerging 2D electronics, with end users including battery manufacturers, chemical companies, semiconductor R&D labs, and advanced materials developers. In 2025, global Niobium Disulfide output was about 3,000 tons with 5,000 tons of capacity, average prices of USD 20,000?40,000 per ton, and gross margins around 37%.

United States market for Niobium Disulfide is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
