The global NIPT(NIPS) Testing Service market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Non-Invasive Prenatal Testing (NIPT), also known as Non-Invasive Prenatal Screening (NIPS), is a highly accurate screening method used during pregnancy to detect certain genetic conditions in the fetus. This test analyzes small fragments of fetal DNA circulating in the pregnant woman's blood to screen for chromosomal abnormalities such as Down syndrome (trisomy 21), Edwards syndrome (trisomy 18), and Patau syndrome (trisomy 13). NIPT is typically performed after the 10th week of pregnancy and is known for its high sensitivity and specificity compared to traditional screening methods. As it is non-invasive, it poses no risk to the fetus and provides early, reliable information, helping expectant parents make informed decisions about further diagnostic testing and management of the pregnancy.

As sequencing costs decrease, the regulatory environment becomes stricter, and the competitive landscape gradually stabilizes, the NIPT market has matured. Coupled with the continued decline in the number of newborns every year, there is little room for market growth. It is expected that the NIPT market size will not grow significantly in the future, but the penetration rate still has considerable room for improvement. The future focus of the market lies in increasing the penetration rate of existing products and incremental technological breakthroughs.
