Nitinol braid components are medical device structures made from nitinol, a nickel-titanium alloy known for its unique shape memory and superelastic properties. These braided components are often used in minimally invasive medical devices like stents, guidewires, and filters due to their flexibility, biocompatibility, and ability to expand or conform to anatomical structures. Nitinol braids provide strength, durability, and adaptability in dynamic environments, making them essential in applications requiring both precise deployment and resilience under physiological conditions. Their ability to return to a predetermined shape enhances their performance in medical procedures.
