Natural killer lymphocytes: NK cells for short, are differentiated from lymphocytes in the bone marrow, accounting for 2% to 5% of the total number of lymphocytes in the blood. NK cells are widely distributed in the human body, in peripheral blood and spleen. , NK cell activity is highest in lymph nodes. NK cells are present in the lamina propria of hollow organ walls and in the interstitium of some solid organs. NK cell activity is lower in bone marrow. NK cells are large lymphocytes with an average diameter of 12~15µm, with more cytoplasm, and many azurophilic granules of different sizes in the cytoplasm, so it is also called large granular lymphocyte (LGL). The nucleus is oval, and under the electron microscope, the cells are The azurophilic granules in the cytoplasm are lysosomes. The chromatin in the nucleus is rich, and heterochromatin is mostly at the edge. There are short microvilli on the cell surface. NK cells do not need antigen activation, let alone the assistance of antibodies. They can Directly killing target cells, such as virus-infected cells and tumor cells, the anti-infection and anti-tumor killing effects of NK cells are broad-spectrum.
