The global No Clean Flux market size is predicted to grow from US\$ 41.16 million in 2025 to US\$ 61.49 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Many small-component PCBs (printed circuit boards) are assembled today with no-clean solder pastes. No-clean solders speed up the manufacturing process by eliminating the need for cleaning circuit boards after reflow. The solder paste did not need removal and stayed in place without any detrimental effect to the function, performance and planned life expectancy of the circuit board. As a result, millions of electronic assemblies are now produced using no-clean solder pastes.
