Nodular pig iron is a type of intermediate product that is created between blast furnace slag and wrought iron. Nodular pig iron is made from scrap metal that has been forged together to create new products, such as steel. Nodular pig iron is also known as high purity pig iron or ductile pig iron, because it is used in the manufacture of ductile iron castings, which have spherical graphite nodules in their microstructure. Nodular pig iron has a high carbon content, typically 3.7 - 4.7%, and low levels of impurities such as phosphorus, sulfur, silicon, and manganese.

The main drivers for the growth of the nodular pig iron market are the increasing demand for ductile iron castings in various industries such as automotive, construction, machinery, and pipes; the superior properties of nodular pig iron such as strength, ductility, corrosion resistance, and machinability; the availability of scrap metal as a raw material; and the technological innovations in nodular pig iron production and application.
