A noise-cut transformer is a device designed to prevent noise interference. It is a trademark developed by DENKEN SEIKI KOGYO K.K. in 1960 and is also called Isolation Transformers, although its common names are fault wave isolation transformers and transformers for noise suppression. Noise-cut transformers are a practical application of transformer-type noise prevention elements.

Since it separates and isolates the source of the noise and the electric circuit on the side disturbed by the noise, it is highly effective in preventing noise. Also, because it is a separate isolation type, it can function even in a poor electromagnetic environment.
