A noise monitoring terminal is a device used to measure and monitor environmental noise levels in a specific area or location. These terminals typically consist of a microphone or sound sensor, data processing unit, and communication interface. They continuously collect and analyze ambient noise data, including sound intensity, frequency, and duration, and provide real-time feedback on noise levels. Noise monitoring terminals are commonly deployed in urban areas, industrial sites, construction zones, and transportation hubs to assess compliance with noise regulations, evaluate the impact of noise pollution on residents and workers, and identify sources of excessive noise.

The global Noise Monitoring Terminal market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
