The global Non-Combustible Building Materials market size is predicted to grow from US\$ 22130 million in 2025 to US\$ 37780 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

The fire-retardant performance of buildings and materials is categorized into three major groups: noncombustible, quasi-incombustible, and flame-retardant. Noncombustibility refers to the ability to withstand high temperatures for a certain period. It protects a building's interior structure by preventing flame spread for a specified duration, even under direct exposure to fire. Quasi-incombustibility has similar heat resistance to noncombustibility but doesn't meet the same duration criteria. Flame-retardant materials resist flames, limiting fire spread and ceasing combustion quickly in case of a fire.
