The global Non-combustible Plate market size is predicted to grow from US\$ 22150 million in 2025 to US\$ 38060 million in 2032; it is expected to grow at a CAGR of 8.2% from 2026 to 2032.

A non-combustible plate is used as interior finishing materials, such as ceilings, columns, and walls, to prevent fires, particularly in their early stages. It is classified as a "fireproof material." Although the material itself absorbs heat, it is characterized by its slow ignition. Specifically, it is a building material that does not ignite for at least 20 minutes after the onset of heating.

Typical non-combustible plates include gypsum plate and calcium silicate plate. A Gypsum board, also known as a plasterboard, is an interior board. Materials such as cloth are applied over this board for finishing. While it is embedded inside and not visible, it is a common material used in various interior parts of a building. However, it is not suitable for use around water, as its thermal insulation is compromised when wet. Silica board, composed of siliceous raw materials, is inherently noncombustible. It differs from gypsum board in its water resistance. The silica board consists of siliceous material, calcareous material, and reinforcing fiber. It is particularly useful in wet and humid areas where gypsum board is less effective. Additionally, it is used in outdoor areas, although not directly exposed to rain.

Non-combustible plates are widely used in buildings to minimize fire damage. They are particularly prevalent in areas with a high potential for fire spread, such as walls, columns, and ceilings. Gypsum board, for instance, is extensively used, except in areas subject to direct water contact, like bathrooms and sinks.

United States market for Non-combustible Plate is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
