The global Non-contact Handheld Thermal Imager market size is predicted to grow from US$ 7502 million in 2025 to US$ 10550 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Thermal Imaging Optical devices are powerful optical tools combining a thermographic camera with a set of optics. A thermographic camera (also called an infrared camera or thermal imaging camera) is a device that forms an image using infrared radiation, similar to a common camera that forms an image using visible light. Instead of the 400–700 nanometer range of the visible light camera, infrared cameras operate in wavelengths as long as 14,000 nm (14 µm). Their use is called thermography.

The non-contact handheld thermal imager is one of the most sought-after advancements in today's market. With the elevation of global health and safety standards, along with the significant impact of pandemics on our way of life and work, there is an ever-increasing demand for monitoring body temperature and health conditions. This type of thermal imager, with its contactless capabilities, swiftly and accurately detects surface temperatures of the human body, making it a preferred tool in public spaces, medical facilities, and industrial sectors.
