The global Non-Contact Laser Extensometers market size is predicted to grow from US$ 121 million in 2025 to US$ 172 million in 2031; it is expected to grow at a CAGR of 6.0% from 2025 to 2031.

A laser extensometer is an extensometer capable of performing strain or elongation measurements on certain materials when they are subjected to loading in a tensile testing machine. The principle works by illuminating the specimen surface with a laser, the reflections from the specimen surface are then received by a CCD camera and processed by complex algorithms. When using a laser extensometer it is not necessary to attach marks to the specimen, bringing substantial time savings for material testing laboratories.

Automation and Industry 4.0 Integration: Integration of Digital Video Extensometers into automated testing setups and Industry 4.0 initiatives enhances efficiency, data accuracy, and workflow automation, driving their adoption in modern manufacturing environments.

Accurate and Non-Contact Measurement: Digital Video Extensometers provide accurate measurements without physically contacting the specimen. This non-contact feature is highly beneficial in preserving the integrity of the material being tested.

High Precision and Resolution: Advancements in camera technology and image processing algorithms have enabled Digital Video Extensometers to achieve high precision and resolution, making them ideal for measuring small deformations and
