The global Non-contact Polygraph market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Non-contact polygraph, also known as a remote polygraph or a computerized polygraph, is a type of lie detector test that measures physiological responses such as changes in heart rate, blood pressure, and respiration, without requiring physical contact with the person being tested.

During a non-contact polygraph test, sensors are attached to the person being tested, typically on the fingers, chest, and arm. The person is then asked a series of questions, and the sensors measure their physiological responses to each question. The results are analyzed by a computer program, which can indicate whether the person is telling the truth or not.

Non-contact polygraph tests are often used in situations where physical contact is not possible or practical, such as in remote locations or with people who are unable to travel. They are also used in situations where the person being tested may be uncomfortable with physical contact, such as survivors of sexual assault.
