Level measurement technology is widely used across many sectors such as construction, industrial, manufacturing, oil and gas, among Others. Radar level measurement technology is categorized on the basis of type as non-contacting transmitter and a contacting transmitter. Radar level measurement is based on calculation of time required for completion of trip between the transducer and sensed material level. Radar level transmitters are ideally used for harsh environment where dust, vapor, or a foaming surface prevents the usage of ultrasonic measurement. The radar level transmitters are used for liquids, solids, or interface application. Based on the type of radar, further classification can be done as FM-CW radar, guided wave, CW radar, and pulse radar depending on the respective applications. Radar level measurement technology relies on “echo” signal which is reflected back from the surface. Thus, radar level transmitters provide accurate and reliable results for any liquids and solids under high pressures and temperatures.

Non-Contact Radar Level Transmitter is a sensor that uses radar principles to measure liquid or solid level. It uses high-frequency electromagnetic waves for measurement and has the characteristics of non-contact, high precision, and real-time monitoring. It is widely used in liquid level measurement and monitoring in chemical, petroleum, food

and Others industries.
