The global Non-Contacting Displacement Sensors market size is predicted to grow from US\$ 2139 million in 2025 to US\$ 3204 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Displacement is a quantity related to the orientation change of an object during motion, and the measurement method of displacement covers a wide range of scales.

Displacement sensors are often used in industrial production. Displacement sensors, also known as linear sensors, are linear devices that belong to metal induction. The function of displacement sensors is to convert various measured physical quantities into electrical energy, and output different electrical energy according to the size of the displacement. The magnitude of the displacement of the signal, and then the magnitude of the displacement can be determined.

The displacement sensor is mainly used to measure distance. The difference between it and the proximity sensor is that the displacement sensor is a precision measurement with an accuracy range between nm and mm, and is used for precision measurement in industry or laboratories. The proximity sensor is an inaccurate indicator, and can only measure two indicators, whether it is close or far away, and is used for primary detection in industry.

Non-contact displacement sensors include laser, magnetoresistive/magnetostrictive, photoelectric, ultrasonic, and eddy current. Different types of downstream core application areas vary greatly.

Displacement sensors are divided into contact and non-contact types. Non-contact

sensors are generally more expensive, with higher measurement accuracy and better durability. The biggest advantage of non-contact sensors is that they can measure objects with dust and oil stains on the surface. This process can avoid dust and oil stains on the surface of the object and achieve accurate measurement. There are many types of non-contact displacement sensors, and the price mainly depends on the range, accuracy and object being measured.

The main driving factors of non-contact industrial displacement sensors are Industry 4.0 and intelligent manufacturing. With the advancement of Industry 4.0, the corresponding equipment and parts will develop towards the trend of intelligence. As an indispensable part of various industrial automation equipment, the displacement sensor will further increase its market size in the future.

Globally, the market size of non-contact industrial displacement sensors accounts for more than 65%. Core companies are mainly distributed in Japan, Europe (mainly Germany), the United States and China. Among them, European companies account for more than 50%, and Chinese local companies still account for a relatively small share of this market. The leading companies in non-contact industrial displacement sensors include Keyence, Ifm, Turck, Omron, Balluff, Temposonics (Amphenol), Miiris, TE Connectivity, SICK, etc. The market share of the top 5 companies is about 30%, and the market is relatively fragmented.
