Non-destructive filter integrity testers are specialized devices used to verify the performance and structural soundness of sterilizing-grade filters without damaging or altering them, ensuring they remain suitable for continued use. These testers typically employ methods such as bubble point, diffusion, or pressure hold testing to assess whether a filter is intact and free of leaks by measuring parameters like gas flow or pressure changes across the filter membrane. Commonly used in pharmaceutical, biotechnology, and food and beverage industries, non-destructive filter integrity testers are essential for maintaining sterility assurance, process validation, and regulatory compliance without interrupting or contaminating production processes.
