## Abstracts

The global Non-Drug-Eluting Devices market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Non-drug eluting devices perform specific functions without releasing drugs. They are used in medical procedures and treatments, focusing on physical or mechanical interventions. Implants typically need removal, while sutures dissolve naturally and do not require removal. Key properties of these devices include primarily providing structural support, being made from biocompatible materials, maintaining sterility to prevent infections, offering high durability and strength, and performing specific functions. Long-term use of drugs to treat cardiovascular diseases may cause some side effects, such as bleeding, liver and kidney damage, etc. Non-drug eluting devices can reduce the amount of drugs used to a certain extent, thereby reducing the risk of drug side effects. With the continuous advancement of medical imaging technology and interventional treatment technology, the treatment of non-drug eluting devices will be more accurate. Doctors can use high-resolution imaging equipment to accurately locate the lesion and select appropriate treatment methods and equipment to improve the treatment effect.

United States market for Non-Drug-Eluting Devices is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
