The global Non-equilibrium Plasma market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Non-equilibrium plasma, often referred to as low-temperature plasma or cold plasma, is a state of matter where the gas is partially ionized, but the electrons are at a much higher temperature than the ions and neutral particles. In this type of plasma, the energy distribution is uneven, meaning that while the electrons can have high kinetic energy, the heavier ions and neutral species remain relatively cool. This characteristic allows non-equilibrium plasma to be used in various applications, such as surface modification, sterilization, and material processing, without causing significant thermal damage to the substrates being treated. Non-equilibrium plasma can be generated under atmospheric or vacuum conditions and is particularly valuable in fields like electronics, biotechnology, and environmental remediation, where precise control over chemical reactions and surface interactions is essential.

United States market for Non-equilibrium Plasma is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Non-equilibrium Plasma is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
