The global Non-Heat-Treated Steel for Automotive market size is predicted to grow from US\$ 4473 million in 2025 to US\$ 5456 million in 2032; it is expected to grow at a CAGR of 3.0% from 2026 to 2032.

In 2025, global Non-Heat-Treated Steel for Automotive production reached approximately 6.28 million tons, with an average global market price of around US\$728 per ton. Non-Heat-Treated Steel for Automotive refers to a type of steel specifically designed and utilized in the automotive industry without undergoing heat treatment processes. It offers certain characteristics such as moderate strength and good formability, which make it suitable for various automotive components where complex shapes need to be formed and where the demands for extremely high strength are not as critical. This type of steel can contribute to cost-effective manufacturing and efficient production of automotive parts, helping to meet the requirements of vehicle design, performance, and mass production while maintaining an appropriate balance between material properties and economic considerations.

Against the backdrop of the global automotive industry's pursuit of lightweighting, emission reduction, and cost optimization, non-heat-treated (NHT) steel has emerged as a core material for manufacturing critical components. By achieving superior mechanical properties without traditional quenching and tempering, it streamlines production. The current market exhibits accelerated technological iteration and expanding applications. Leading producers like Baowu Group and CITIC Special Steel have achieved stable supply of high-end varieties, such as high-sulfur and high-calcium aluminum-containing NHT steel, effectively meeting demand for specialized auto parts.

The development trend is shifting from conventional ferrite-pearlite microstructures

toward bainitic types and higher strength grades to satisfy requirements for high fatigue strength and machining efficiency in components like crankshafts, connecting rods, and steering knuckles. Opportunities are primarily driven by stringent global emission regulations and the structural efficiency needs of electric vehicles. NHT steel enhances green competitiveness by shortening manufacturing cycles, reducing energy consumption, and eliminating heat treatment distortion.

However, barriers remain, including the rigorous requirement for precise chemical composition control and limitations in the cold-forming capability of complex parts. According to official disclosures from ThyssenKrupp and Nippon Steel, the industry is transitioning toward low-carbon production. Utilizing Electric Arc Furnaces (EAF) and high-purity scrap (e.g., TSR40) to produce automotive-grade special steel is becoming a strategic consensus. Moving forward, competition in the NHT steel market will focus on material solutions that balance low-carbon manufacturing with extreme fatigue life performance.
