Non-human identity management (NHIM) software is a security architecture for governing and provisioning digital personas within organizations that belong to anything other than real people. This type of NHIM software manages devices, cloud workloads, AI agents, service accounts, applications, bots, scripts, IoT hardware, automated pipelines, and other machine identities. NHIM software encompasses how these identities are created, secured, granted permissions, monitored, and retired, ensuring that these machine identities operate safely within defined roles with only the access they need. As an identity management architecture, NHIM software is related to traditional identity access management (IAM) software and customer identity access management (CIAM) software but differs from both. While IAM software manages employee access and CIAM software manages customer logins, NHIM provisions, manages, discovers, and continuously monitors numerous non-human identities.
