Non-injectable insulin refers to a class of medications used to treat diabetes that do not need to be administered by injection. These medications are usually given orally or by other non-injectable routes to help control blood sugar levels and reduce or delay the onset of diabetes-related complications.

People with diabetes rely on insulin to control their blood glucose levels. This drug regulates and controls blood glucose levels by injected subcutaneously. A report from 2022 indicated that diabetes drugs around the world generated revenue of \$78 billion. Since insulin is the preferred drug of choice for most diabetics, nasal or oral insulin intake provides comfort as an effective alternative to all other diabetes drugs.
