The research report highlights the growth potential of the global Non-invasive Brain Stimulation System market. Non-invasive Brain Stimulation System are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Non-invasive Brain Stimulation System. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Non-invasive Brain Stimulation System market.

The function of the brain is mainly studied by using techniques such as EEG or functional MRI. Brain stimulation method is also used to study the activity of the brain. The brain stimulation method comprises of repetitive Transcranial Magnetic Stimulation (rTMS) and Transcranial Current Stimulation (tCS). These two techniques are used to disrupt the activity of the brain as well as it is used to enhance the brain function. These two techniques are collectively known as non-invasive brain stimulation. The transcranial magnetic stimulation refers to the generation of magnetic pulses that easily transfers to the skull and other matter in the brain. The electrical potential are generated in brain, depolarizing the neurons and trigger action potentials. The tCS involves the direct or alternating current, the pair of electrode are placed over the head and one is placed

over the target brain area.
