Non-invasive Cryolipolysis Machines use a technology called Cryolipolysis, which uses low temperatures to destroy and eliminate fat cells in specific areas.

The basic principle of cryolipolysis is to control the cooling of local tissues so that fat cells naturally undergo apoptosis at low temperatures and are subsequently metabolized by the body. This method is considered non-invasive because it does not involve surgical cuts or injections, so the recovery period is short and the risks are relatively low.

The global Non-invasive Cryolipolysis Machines market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
