Non-invasive flow sensor is a device used to measure the flow rate of a fluid without direct contact or intrusion into the flow stream. It is designed to monitor fluid flow in a non-intrusive manner, eliminating the need for physical components within the flow path.

The detailed definition of a non-invasive flow sensor includes the following aspects:

- 1. Operation Principle:** Non-invasive flow sensors utilize various principles and techniques to measure flow without physical contact with the fluid. Commonly used methods include ultrasonic, magnetic, thermal, optical, or Doppler-based technologies. These principles rely on the detection and analysis of changes or disturbances caused by the flowing fluid.
- 2. Installation and Mounting:** Non-invasive flow sensors are typically mounted externally to the pipe or conduit that carries the fluid. They may be clamped or attached to the outer surface of the pipe or mounted nearby to measure flow using non-contact methods. This installation allows measurement without requiring any modification or interruption of the flow stream.
- 3. Measurement Accuracy:** Non-invasive flow sensors provide flow rate measurements with a certain level of accuracy and precision. The accuracy may vary depending on the technology used, the conditions of the application, and the calibration of the sensor. It is essential to consider factors such as fluid properties, pipe material, pipe diameter, and installation parameters to optimize the accuracy of the measurement.
- 4. Application Range:** Non-invasive flow sensors are suitable for a wide range of fluids, including liquids and gases. They find applications in industries such as water management, HVAC systems, industrial processes, energy management, and research, where non-intrusive flow measurement is desired or necessary.
- 5. Output and Data Analysis:** Non-invasive flow sensors provide real-time data and often offer digital or analog output signals to monitor and record flow rate measurements. They may integrate with data acquisition systems, control systems, or display units for further data analysis, control, or integration into larger monitoring or control networks.

Non-invasive flow sensors offer benefits such as minimal disruption to the flow process, reduced maintenance requirements, lower risk of contamination or blockage, and easy retrofitting to existing systems. However, it is important to ensure compatibility with the application requirements, accounting for factors such as pipe size, pipe material, fluid properties, flow profile, and flow rate range when selecting a non-invasive flow sensor for a specific application.
