The global Non-Isolated DC Converters market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A non-isolated DC converter is a power converter that converts one DC voltage to another DC voltage of a different voltage without electrical isolation between the input and output.

Non-isolated DC converters usually consist of switching devices, inductors, capacitors, and control circuits. It converts the DC voltage into a high-frequency AC voltage, and then filters the AC through components such as inductors and capacitors to finally obtain the required output voltage.

Compared with isolated DC converters, non-isolated DC converters have a simpler circuit structure and lower cost. However, since the input and output are not electrically isolated, non-isolated DC converters may present safety hazards and EMI issues in some applications. Therefore, when choosing to use a non-isolated DC converter, its safety and reliability need to be carefully considered to ensure that it complies with relevant electrical safety standards and regulations.

United States market for Non-Isolated DC Converters is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Non-Isolated DC Converters is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
