The global Non-isolated Gate Drivers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Non-Isolated Gate Drivers are a class of drivers used to drive semiconductor switching devices such as MOSFETs or IGBTs. In contrast to isolated gate drivers, non-isolated types do not provide electrical isolation because they do not use transformers or other isolation components to split the ground between the control circuit and the high-voltage switching circuit. A non-isolated gate driver is a circuit that provides only the basic gate drive signal. It directly converts a low-voltage control signal into a high-voltage switching signal suitable for the gate of a MOSFET or IGBT. The absence of isolation means that the driver and the power switch being driven are electrically directly connected, making it suitable for applications where high voltage isolation is not required.

United States market for Non-isolated Gate Drivers is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Non-isolated Gate Drivers is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
