A non-latching reed relay is a special type of relay that uses a magnetic reed as the switching element. It corresponds to a traditional latching reed relay and does not require a continuous control signal to maintain state. Non-latching reed relays are based on the working principle of magnetic reeds, and the switching state of the relay is controlled by a magnetic field. It consists of a magnetic spring as a movable contact that flips or bends when the reed is subjected to an external magnetic field, causing the

contact to open or close. A non-latching reed relay is characterized in that it remains switched in the presence of an external magnetic field without the need for a continuous control signal. Once the external magnetic field disappears, the relay will return to the default state. This makes non-latching reed relays useful in applications that require a maintained state, such as remaining open when power is interrupted. Non-latching reed relays are commonly used in applications requiring fast response and low power consumption, such as communication equipment, measuring instruments, medical equipment, and automation systems. They have the advantages of high reliability, fast switching speed and long life.
