## Abstracts

The global Non-oxidizing Bactericides market size is predicted to grow from US\$ 2887 million in 2025 to US\$ 3885 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Non-oxidizing bactericides are chemical agents that kill microorganisms without relying on oxidation reactions, but rather by disrupting cell membranes, inhibiting enzyme activity, or interfering with metabolic processes. They are widely used in water treatment, oil and gas, papermaking, and industrial recycling systems. The global market price for non-oxidizing bactericides is \$1,553 per ton, with annual sales of approximately 1.9 million tons and a global annual production capacity of approximately 2 million tons. The industry profit margin is 10%.

### Global Regional Market Landscape

**North America:** A key global market with mature industrial circulating water, energy and chemical, manufacturing, and membrane reuse systems. Customers emphasize verifiable bactericidal effects, online monitoring, on-site service, and closed-loop compliance documentation. The EPA's registration management of antimicrobial products under the FIFRA framework further strengthens market entry barriers. **Europe:** Stricter regulations. The BPR requires dual compliance for active substances and product authorization, coupled with Legionella control, environmental emissions, and long-term stable system operation requirements. The market prefers solutions with high reliability, low side effects, and complete evidence chains. **Asia Pacific:** Leading growth rate. With a high concentration of manufacturing, industrial parks, and large water usage in industries such as paper and electronics, demand for cooling water and process water treatment is strong. The focus of competition is 'formulation compatibility

+ dosing flexibility + cost-effectiveness + localized service response.' LANXESS has specifically launched a water treatment microbial control product portfolio for APAC. Emerging Markets: Primarily focused on basic industrial cooling water, general process water, and resource development scenarios. Customers are more cost-sensitive, but as downtime losses and the costs of MIC corrosion are re-evaluated, demand for highly efficient non-oxidizing bactericides is steadily increasing.

## Upstream and Downstream Industry Chain

### From Active Material Formulation to Collaborative Delivery of Online Monitoring and On-site Services

Upstream: Active materials such as isothiazolinones, DBNPA, THPS, guanidines/quaternary ammonium salts, etc., along with supporting solvents, stabilizers, dispersants, corrosion and scale inhibitors, as well as metering pumps, automatic dosing devices, solid dosing devices, and online monitoring and control systems. Nalco publicly demonstrated a solid non-oxidizing bactericide dosing device for HVAC open cooling systems; Solenis integrates biofilm monitoring and dosing control as part of its overall solution. Downstream Typical Customers: Cooling towers in petrochemical and chemical plants, circulating water systems in power plants, RO/UF membrane water plants, liquid cooling loops in data centers and manufacturing, wet end systems in pulp and paper mills, oil and gas production/reinjection/fracturing water systems, and industrial water storage and distribution systems. Public application data from Veolia, LANXESS, THOR, and Baker Hughes all show that the value of non-oxidizing bactericides has expanded from single-point sterilization to reducing slime, inhibiting biofilm, lowering MIC, and extending membrane and equipment lifespan.

## Technological Trends and Innovations

1) From Single Agents to Integrated 'Oxidation + Non-Oxidation + Dispersion + Monitoring' Processes: Mainstream suppliers are increasingly moving away from selling single non-oxidizing biocides and instead packaging them with oxidizing agents, biodispersants, automated dosing, and monitoring technologies to enhance systemic control. Publicly available solutions from Nalco Water, Solenis, and Baker Hughes demonstrate this trend. 2) Optimization of Membrane System Compatibility with Sensitive Materials: Veolia positions BioMate as an EPA-registered non-oxidizing biocide compatible with RO/UF membranes; DuPont, in its DBNPA technical documentation, specifically notes that biocides and their degradation products are not necessarily completely retained by RO membranes, and shock dosing may require

permeate discharge and alkaline washing to remove dead biofilm. This indicates that future innovation will focus not only on 'faster killing,' but also on 'cleaner killing, more membrane-friendly treatment, and more controllable post-treatment.' 3) Greater emphasis on green, precise, and low total dosage: The EPA has cited THPS as a relatively 'green' industrial biocidal chemical, emphasizing its low recommended dosage, rapid environmental degradation, and low bioaccumulation. Solenis, in 2024, publicly demonstrated a new approach to optimize bactericide dosing by measuring biofilm thickness in real time. The industry will shift from 'experience-based dosing' to 'precise dosing based on risk, data, and system status.'

## Policy and Compliance

The bottom line is traceability in product registration, labeling, system records, and emission control. Non-oxidizing bactericides are not ordinary adjuvants but highly regulated antimicrobial products. In the US, the EPA manages antimicrobial pesticides under the FIFRA framework and has specific regulations for data requirements, registration, and labeling. In the EU, the BPR explicitly requires that active substances be approved and products authorized before they can be marketed and used. For cooling tower systems, HSE ACOP L8 and related technical guidelines emphasize identifying Legionella risks, developing control plans, implementing monitoring, maintaining records, and designating responsible parties. In other words, the real industry barrier isn't just about being able to formulate a product, but rather 'whether it can be sold legally, used correctly, and its effectiveness and responsibility chain can be documented.'

## Future Outlook

### From 'Auxiliary Agent' to 'Core Biocontrol Platform for Highly Stable Industrial Water Systems'

As industrial systems move towards high reuse, low downtime, low energy consumption, and high reliability, the value of non-oxidizing bactericides is being redefined?they are no longer just a barrel of chemicals in cooling towers or membrane systems, but a critical control platform directly impacting heat exchange efficiency, membrane cleaning cycles, corrosion rates, downtime losses, Legionella risk, and EHS pressure. The future winners will often not be the lowest-priced suppliers, but rather the supply chain that can deeply integrate active substance systems, biofilm mechanisms, programmed dosing, online monitoring, label compliance, and on-site services, enabling customers to achieve 'more accurate disinfection, more stable membranes, cleaner

towers, and less downtime.' Major manufacturers such as Veolia, Nalco Water, Solenis, and LANXESS have already outlined this roadmap in their publicly available product and service systems.
