According to our (LP Info Research) latest study, the global Non-phosgene Polycarbonate market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Non-phosgene Polycarbonate is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Non-phosgene Polycarbonate market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Non-phosgene Polycarbonate are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Non-phosgene Polycarbonate. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Non-phosgene Polycarbonate market.

Non-phosgene polycarbonate, also known as direct transesterification polycarbonate, is a method used to produce polycarbonate (PC). Traditional polycarbonate production uses phosgene as a reaction raw material, but phosgene is a toxic and harmful gas that poses environmental and worker safety risks. To reduce these risks, direct transesterification polycarbonates were developed. In this method, the transesterification reaction is directly used in the synthesis of polycarbonate, avoiding the use of phosgene. The production process includes preparation of raw materials, transesterification reaction, dehydration reaction and post-treatment, and finally obtains

high-performance polycarbonate products. This method is widely used in the polycarbonate industry, which not only reduces environmental risks, but also improves the safety and efficiency of production.

The industrial production methods of polycarbonate mainly include interface polycondensation method, melt transesterification polycondensation method and non-phosgene melt transesterification polycondensation method. The first two types are also called 'phosgene method', and the latter type is 'Non-phosgene method'. The main factories using non-phosgene melt polymerization include Covestro Thailand Map Ta Phut polycarbonate plant, Covestro Krefeld polycarbonate plant and Saudi Kayan Petrochemical Company Al-Jubail polycarbonate plant, Japan Asahi Kasei, China Shingwa Advanced, etc. In terms of global production capacity, phosgene and semi-phosgene production capacity accounted for 65.96%; China's phosgene and semi-phosgene production capacity accounted for about 51% of the country's total production capacity. At present, the growth of demand in Asia has led to the rapid growth of polycarbonate production capacity in the world, and the production center has shifted to Asia, especially to developing countries such as China.
