The global Non-pleated Air Filters market size is predicted to grow from US\$ 369 million in 2025 to US\$ 533 million in 2031; it is expected to grow at a CAGR of 6.3% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Non-pleated filters are made of fiberglass or some other electrostatic material, which is weaved about in a random fashion to create a barrier through which air passes. Compared to pleated air filters, non-pleated air filters are less expensive.

The air filters are a critical component of the HVAC system used in internal combustion engines to remove minute particulates. They are an essential component of air-moving devices like fan coils, terminal units, and air handlers. They clean the dirt that causes fan wheel imbalances and coil blockages. The principle is to protect people's health by keeping the ventilation system clean and ensuring a high level of hygiene (IAQ).

Furthermore, the increasing number of passenger cars on the roads, particularly in developing economies, the increased focus on environmental sustainability goals globally, the growth and expansion of the automotive industry, particularly in developing economies, and stringent government norms and regulations regarding pollution emission rate control parameters are the major factors driving the growth of the air filters market. Increasing airborne infections and rising pollution levels in urban areas are expected to propel the market.
