The global Non-recombinant Coagulation Factors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Non-recombinant coagulation factors refer to coagulation factors synthesized by the human body itself, which are different from coagulation factors synthesized through genetic recombination technology (recombinant coagulation factors). These coagulation factors are synthesized by the liver and other tissues of the human body under normal circumstances and play an important role in the coagulation process, helping to stop bleeding and maintain blood coagulation balance. Non-recombinant clotting factors are usually obtained from blood donations from healthy people.
