Non-selective broadleaf herbicides are a type of chemical herbicide that can kill a wide range of broadleaf plants (including crops and weeds). They are not selective, that is, they will kill both target weeds and non-target plants after contact. They usually cause plants to wilt or die quickly by destroying photosynthesis, protein synthesis or cell membrane structure. Representative ingredients include glyphosate, glufosinate and saflufenacil. Due to their broad spectrum and high efficiency, non-selective broadleaf herbicides are mainly used to remove weeds before tilling of cultivated land, clean up non-cultivated land (such as railways, highways, gardens, and orchards), and control weeds in industrial land. They are an indispensable basic weed control tool in modern agriculture and environmental management.

United States market for Non-Selective Broadleaf Herbicides is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
