The global Non-wearable Dosimetry market size is predicted to grow from US\$ 1266 million in 2025 to US\$ 1804 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Non-wearable dosimetry involves the use of stationary or portable devices that are not worn on the body but are instead placed in specific locations to measure and monitor radiation levels in a given environment. These devices are commonly used in medical facilities, nuclear power plants, research laboratories, and industrial settings to assess radiation exposure in a broader area or at specific points of interest. Unlike wearable dosimeters, non-wearable dosimetry provides environmental or area-based readings, helping to ensure that radiation levels remain within safe limits for anyone present in the monitored space. These measurements are crucial for maintaining safety standards, regulatory compliance, and for conducting risk assessments in environments where radiation exposure is a concern.

United States market for Non-wearable Dosimetry is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
