NSA is a liquid succinic anhydride for curing low-viscosity epoxy resin. The advantages of NSA include long pot life as well as improved water resistance. NSA is manufactured from maleic anhydride and a mixture of branched olefin isomers. The olefin side chain is primarily the C9 trimer of propylene, which retains its double bond. NSA may be hydrolyzed to the dibasic acid with hot water. The acid may be reacted with amines or alkali metal aqueous bases. NSA readily forms mono-or di-esters.
