The report requires updating with new data and is sent in 48 hours after order is placed.

The nonlinear junction detector sends out the high-frequency fundamental wave of S-band to the target area or target object through the transmitting end of the device, and captures the second harmonic generated from the target object by the receiving end. After the learning algorithm analyzes and processes the harmonic signal, it gives the harmonic variation law before and after the fundamental wave emission, so that the electronic equipment with nonlinear junction can be effectively identified.
