Nonstimulant ADHD treatment drugs are an alternative to stimulant medications for managing Attention Deficit Hyperactivity Disorder (ADHD). These medications include substances like atomoxetine (Strattera), guanfacine (Intuniv), and clonidine (Kapvay). Unlike stimulants, which increase dopamine and norepinephrine levels rapidly, nonstimulants work more gradually by modulating neurotransmitters subtly over time. They are particularly useful for patients who may not respond well to stimulants, or who experience significant side effects. Nonstimulants are noted for their ability to improve concentration, decrease impulsivity, and reduce hyperactivity, with a lower potential for abuse. They can be a good option for individuals seeking a medication regimen with a different side effect profile or mechanism of action compared to traditional stimulant therapies.

The global Nonstimulant ADHD Treatment Drugs market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
