Normal paraffin is a type of hydrocarbon that has a straight-chain structure and a single bond between carbon atoms. It is also known as n-paraffin or n-alkane. Normal paraffin is widely used as a raw material for the production of linear alkylbenzene (LAB), which is the main ingredient for detergents. Normal paraffin can also be used as a solvent, lubricant, fuel, or wax .

The industry trend of normal paraffin is driven by the increasing demand for detergents, especially in emerging markets such as Asia-Pacific, Middle East, and Africa. Some of the factors that contribute to this growth are:

The rising population and urbanization in developing countries

The growing awareness of hygiene and sanitation among consumers

The increasing preference for biodegradable and eco-friendly detergents

The expanding use of normal paraffin in other applications such as solvents, lubricants, fuels, and waxes
