The normally closed reed switch is a passive component based on magnetic control, consisting of a pair of ferromagnetic reeds sealed in a glass tube. When there is no external magnetic field, the reeds are in contact due to their own elasticity, forming a closed circuit (normally closed state); when an external magnetic field is applied, the reeds are magnetized and attract each other, the contacts are disconnected, and after the magnetic field disappears, the reeds resume contact, which is suitable for circuits that require a default path and automatic recovery after power failure (such as safety systems, fault detection, signal switching).
