The mechanism of action of antiviral drugs is mainly to inhibit the entry of viral particles into host cells and to inhibit the early stages of viral replication. There is also an inhibitor of DNA polymerase, which is mainly due to its ability to inhibit viral coding. At present, new antiviral drugs are actively seeking host factors, both in the initial stage of viral infection and in the later stages of nuclear transport of viral RNP complexes, to produce new drugs with new modes of action without drug resistance.
