Nitrogen and oxygen are the two main components of atmospheric air, but they do not react at ambient temperature. However, in the heat of combustion, such as in a vehicle engine or within an industrial process or furnace, the two gases react to form nitrogen oxide (NO) and nitrogen dioxide (NO₂). This is an important consideration for the developers and manufacturers of combustion equipment because emissions of these gases (collectively known as NO_x) have serious health and environmental effects, and are therefore tightly regulated.
