Nozzles for Continuous Casting Cooling are crucial components on continuous casting machines in steel production, responsible for spraying cooling water onto the surface of the cast slab during the casting process to quickly remove heat generated inside the slab, control the solidification and cooling rate of the slab, and ensure the quality and dimensional accuracy of the slab. These nozzles are typically made of high-temperature and wear-resistant materials to adapt to the high-temperature and highly corrosive working environment during continuous casting. Meanwhile, their design considers factors such as water flow distribution, spray angle, and pressure to ensure that cooling water can uniformly and efficiently cover the surface of the cast slab, avoiding defects such as cracks and deformations caused by localized overheating or uneven cooling. By precisely controlling the cooling effect of the nozzles and the solidification process of the cast slab, the production efficiency of continuous casting machines and the yield of finished cast slabs can be significantly improved, reducing production costs and providing strong support for the production of steel enterprises.

United States market for Nozzles for Continuous Casting Cooling is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
