The three connected terminals in the NPN and PNP transistors are called emitter (emitter, E), base (base, B) and collector (collector, C) in sequence. NPN uses the current of B?E (IB) to control the current of C?E (IC), the potential of the E pole is the lowest, and the potential of the C pole is usually the highest during normal amplification, that is, $V_C > V_B > V_E$. PNP uses E?B current (IB) to control E?C current (IC). The potential of the E electrode is the highest, and the potential of the C electrode is usually

the lowest during normal amplification, that is, VC LPI (LP Information)' newest research report, the “NPN and PNP Triodes Industry Forecast” looks at past sales and reviews total world NPN and PNP Triodes sales in 2022, providing a comprehensive analysis by region and market sector of projected NPN and PNP Triodes sales for 2023 through 2029.
