NTD single crystal rod is a single crystal silicon rod grown through neutron transmutation doping technology. It is characterized by a very uniform doping impurity concentration distribution and is suitable for manufacturing high-power semiconductor devices. NTD technology uses neutron irradiation to dope silicon materials. Through thermal neutron irradiation, some silicon isotope atoms can be converted into phosphorus (P) atoms, thus the donor phosphorus appears in the silicon. Making silicon N-type. The advantages of NTD single crystal rods are high purity, low oxygen content, low defect density, high resistivity uniformity and other characteristics.
